

## We're taking security to the next level

With the ever-changing landscape of technology, and the ever-prevalent presence of fraud, securing your account information has never been more important.

**Unified Identity Service (UIS)** replaces the basic multi-factor authentication service used today and adopts industry-standard authentication methods designed to protect against varying types of online account takeover threats.

## **Benefits of UIS:**

- Infrastructure designed to identify and block credential stuffing attacks.
- Preventions to make it difficult for phishing and other attack schemes to be possible.
- Single identity to manage multiple profiles at the bank (if applicable).
- Ongoing and inherent benefit of the software's security strategy.

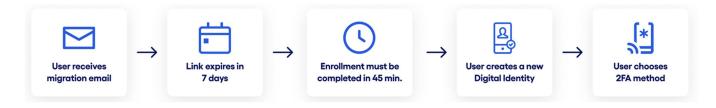

## **What to Expect**

You'll be prompted to create a new Digital Identity for ongoing access which is a simple four-step process:

- 1. Take action from the link provided in an email generated specifically for you.
- 2. Authenticate with your existing Company and Login ID.
- 3. Create a new digital profile, including a unique Username.
- 4. Establish a new two-factor authentication (2FA) method for subsequent account access.

## That's it!

There are specific timeframes associated with the creation of the Digital Identity, and if the steps are not completed timely it will result in not being able to access your accounts until your profile is manually maintained.

To ensure a smooth transition, we will communicate well in advance of this change, so please pay special attention to information shared via email, Information Center, Banner, or Modal messages.

We're looking forward to bringing you these positive changes! Please stay tuned for more information, and we appreciate your prompt attention to these changes when the migration is underway.

Let's keep the conversation going.
